

PDFAR

Advanced PDF Reader for Linux

This document is a rendering test bench. It contains headings, paragraphs, a chart and multi-column text so you can verify page rendering, zooming, search highlights and text selection.

Try: Ctrl+F to search · F3 for next hit · Ctrl+wheel to zoom

1. Architecture

PDFAR renders pages on background threads and paints them directly, so scrolling stays responsive even in very large documents. The render pool keeps a priority queue: pages you can see are always rendered before pages you cannot.

Text selection works on the real PDF text layer. Drag across words, across pages, or press Ctrl+A to select everything, then Ctrl+C to copy. Rotation never breaks the mapping between what you see and what you select.

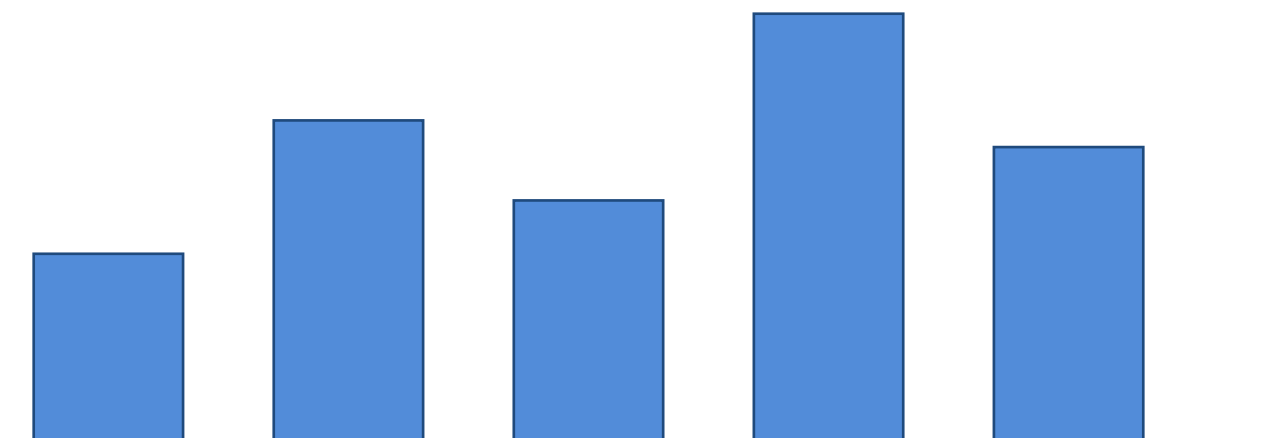

Search supports AND, OR and exact-phrase queries with optional case sensitivity and whole-word matching. Every match is highlighted, and F3 jumps between hits without losing your place.

The sidebar shows thumbnails rendered in the background and the document outline, so you can navigate long reports the way you would with a native application.

2. Rendering pipeline

PDFAR renders pages on background threads and paints them directly, so scrolling stays responsive even in very large documents. The render pool keeps a priority queue: pages you can see are always rendered before pages you cannot.

Text selection works on the real PDF text layer. Drag across words, across pages, or press Ctrl+A to select everything, then Ctrl+C to copy. Rotation never breaks the mapping between what you see and what you select.
